

Task 1: Mobile App UX Case Study - Freelance Management App

1. Project Overview

This project focuses on designing a comprehensive mobile application tailored for freelancers like Meera. The goal is to provide independent professionals with a centralized workspace to manage projects, track earnings, monitor client interactions, and instantly handle billing. By unifying these fragmented tasks into a single platform, the app eliminates administrative fatigue and allows freelancers to focus on growing their business.

2. Problem Statement

Freelancers like Meera frequently struggle to manage their daily business operations due to fragmented workflows. They are forced to juggle multiple disconnected tools to track active deadlines, view financial metrics, and bill clients. This disjointed experience leads to missed payment cycles, poor administrative visibility, and high cognitive load. The challenge is to design an intuitive, cohesive mobile interface that unifies project management and financial tracking smoothly.

3. User Persona Summary

- **Target User:** Meera, an independent freelancer / solo entrepreneur.
- **Core Needs:** Real-time earnings visibility, centralized task tracking, simplified client onboarding, and instant, painless invoicing.

4. Key Design Decisions (5-Screen Flow)

- **User Persona Screen:** Created a dedicated foundational frame focusing on Meera's workflow to align the visual interface directly with her specific freelancer pain points.
- **Low-Fidelity Wireframes:** Developed an initial architectural skeleton to focus strictly on structural hierarchy, placement of core features, and intuitive navigation before applying visual styles.
- **Dashboard & Analytics:** Implemented high-fidelity data visualization cards displaying total revenue, active tasks, and client analytics using a crisp design system with clear visual hierarchy.
- **Navigation & Interaction:** Established a clean, persistent bottom navigation layout paired with high-contrast call-to-action buttons (using a signature brand blue) to minimize user friction.
- **Invoice Management Screen:** Added a dedicated "Create Invoice" screen featuring clean, low-cognitive-load text input fields and a high-contrast action button. This directly enables Meera to generate and dispatch billing statements instantly without leaving her application workspace.
